DETAILED ACTION

EXAMINER'S AMENDMENT

1. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Marc S. Hanish (Reg. No. 42,626) on 12/20/04.

The application has been amended as follows:

- Deleted the old Abstract, and replace with new abstract as below:

“Abstract of The Disclosure

A gateway is provided which routes a packet sent from a user to a connected network utilizing a per-user routing table. This is accomplished by extracting a source address from the packet; finding a per-user routing table corresponding to the source address, the per-user routing table containing entries corresponding to one or more currently accessible networks for the user and the range of network addresses corresponding to the currently accessible networks; extracting a destination address from the packet; seeking an entry in the matching per-user routing table with a range of network addresses containing the destination address; routing the packet to a matching network if the destination address is contained within one of the ranges of network addresses for the currently accessible networks; and routing the packet to a default network if the destination address is not contained within one of the ranges of network addresses for the

currently accessible networks. This allows different users to have access to a different set of networks and allows a user to select the network he wishes to access. The gateway may also guarantee that packet are routed through a particular destination ISP or network by looking up the destination ISP or network in a table, each entry in the table having a router network address corresponding to each network currently accessible; establishing a tunneling session to the matching router network address; and forwarding the packet to the router network address through the tunneling session.”
